

In The Future...

In the future I believe that technology will advance to solve some of our worst problems. I think the smallest corners and our largest fields will all be altered by the actions we take in the future. This is Nathan Regular and I am going to take you on a journey to our future where our present is their past. Join me as I show you how our current actions will forever alter our earth.

The first key thing that builds up our world as we know it, is our environment: The very structure that makes up our world. I will show you how much can change about everything in 50 years. The plants that inhabit our time period will have changed. Some may change a lot, some may only change the slightest bit, but altogether, they will be different. The flora that would grow in the future will be unrecognisable from our plants now. They will be gene edited, perfected to such clarity as the very genes that build up all living things. The plants will be gene edited for many different things. Some fruits will be edited for tastier flavour and some to produce more oxygen, or suck up more CO₂. As for our problem now with climate change, scientists are going to invent solar panels that will collect 80 percent of the sun's energy. Those panels will be high on the market because they will be a cheaper source of energy than coal or oil. Then climate change will stop and even start to reverse itself. Don't worry, our world is in safe hands.

The next major element that will be affected in the future is the way we will travel in space. I think that we will be able to travel extremely far and at a fast speed. I think we will find a fuel that is lightweight and very potent, meaning that our rockets will be able to go much farther. Also, because of the fuel potency, the rocket will be able to harness more power, sending it at a much faster speed. Imagine how far we will be able to go, and who knows what's really out there.

Cancer and many other terrible diseases infest our world. But what will happen to them? In the future, cancer will be a name of the past. Scientists will have invented nanotechnology that will hunt down cancer cells and destroy them. It is also believed that scientists may be able to use this very same nanotech to repair damaged cells in

our bodies. Basically, this technology could be the key to humans living for hundreds more years. Also the ability to gene edit will be useful for destroying diseases like cancer or heart disease. We are evolving. It will be safer and easier in the future, but still, stay in good shape.

Despite the many differences, what I think will be the same will be things like the rich, beautiful culture that our world provides to us and the elegance of the things right in front of us. Always look forward, but never disrespect the wonder in the world we already have. Thank you. This is Nathan Regular wishing you a good journey to the future!
